- Operator $F : \mathcal{X} \to \mathcal{Y}$, continuously Fréchet differentiable.
- Noisy data $y^{\delta} \in \mathcal{Y}$ and noise level $\delta \in \mathbb{R}^+$.

Problem

$$F(x) = y^{(\delta)}$$

The noisy data y^{δ} satisfies

$$\left\| y - y^{\delta} \right\| \leq \delta \, .$$

Conclusion				

$$\begin{split} z_k^{\delta} &= x_k^{\delta} + \lambda_k^{\delta} (x_k^{\delta} - x_{k-1}^{\delta}) \,, \\ x_{k+1}^{\delta} &= z_k^{\delta} + \alpha_k^{\delta} \mathcal{F}'(z_k^{\delta})^* (y^{\delta} - \mathcal{F}(z_k^{\delta})) \,, \end{split}$$

- converge under standard assumptions,
- are very easy to implement,
- require no more computation time than Landweber iteration,

Introduction	TPG Methods	Convergence Analysis	Numerical Results	Conclusion
000000	0000000		00000	●0
Conclusion				

$$\begin{split} z_k^{\delta} &= x_k^{\delta} + \lambda_k^{\delta} (x_k^{\delta} - x_{k-1}^{\delta}) \,, \\ x_{k+1}^{\delta} &= z_k^{\delta} + \alpha_k^{\delta} F'(z_k^{\delta})^* (y^{\delta} - F(z_k^{\delta})) \,, \end{split}$$

- converge under standard assumptions,
- are very easy to implement,
- require no more computation time than Landweber iteration,
- and lead to a considerable speed-up in practise.

$$\left\|x_{k_*}^{\delta}-x^{\dagger}\right\|=\mathcal{O}\left(\delta^{rac{2\mu}{2\mu+1}}
ight)\,,\qquad k_*(\delta,y^{\delta})=\psi(\delta)\,.$$

• Nonlinear problems and original Nesterov parameter

$$\lambda_k^{\delta} = \frac{k-1}{k+\alpha-1}$$

- Analysis only under local convexity assumption.
- Weakening of convexity assumption to, e.g., quasi-convexity.
